

$$7) \quad a) \quad P = \frac{2}{2 - \sin t} \quad t=0 \Rightarrow P=1$$

$$\frac{1}{P(2P-1)} \equiv \frac{2}{2P-1} - \frac{1}{P}$$

$$i) \quad \text{Max } P = \frac{2}{2-1} = 2$$

$$ii) \quad \int \frac{1}{2P^2-P} dP = \int \frac{1}{2} \cos t dt$$

$$\text{Min } P = \frac{2}{2-(-1)} = \frac{2}{3}$$

$$\int \left( \frac{2}{2P-1} - \frac{1}{P} \right) dP = \int \frac{1}{2} \cos t dt$$

$$iii) \quad P = \frac{2}{2 - \sin t}$$

$$\ln(2P-1) - \ln P = \frac{1}{2} \sin t + C$$

$$\frac{dP}{dt} = \frac{(2-\sin t)0 - 2(-\cos t)}{(2-\sin t)^2}$$

$P=1$ , when  $t=0$  so

$$\frac{dP}{dt} = \frac{2 \cos t}{(2-\sin t)^2}$$

$$\ln \left( \frac{1}{1} \right) = \frac{1}{2} \sin 0 + C$$

$$\frac{dP}{dt} = \frac{1}{2} \times \frac{4}{(2-\sin t)^2} \cos t$$

$$0 = 0 + C \Rightarrow C = 0$$

$$\frac{dP}{dt} = \frac{1}{2} P^2 \cos t$$

$$\therefore \ln \left( \frac{2P-1}{P} \right) = \frac{1}{2} \sin t$$

$\therefore P$  satisfies this diff. eqn.

iii)

$$P = \frac{1}{2 - e^{\frac{1}{2} \sin t}}$$

$$7b) \quad \frac{dP}{dt} = \frac{1}{2} (2P^2 - P) \cos t$$

$$\text{Min } P = \frac{1}{2 - e^{-0.5}}$$

$$i) \quad \text{Let } \frac{1}{P(2P-1)} \equiv \frac{A}{P} + \frac{B}{2P-1}$$

$$= 0.718 \text{ to 3 d.p.}$$

$$\Rightarrow 1 \equiv A(2P-1) + BP$$

Max P

$$= \frac{1}{2 - e^{0.5}}$$

When  $P=0$

$$= 2.847 \text{ to 3 d.p.}$$

$$1 = -A \Rightarrow A = -1$$

When  $P = \frac{1}{2}$

$$1 = \frac{1}{2} B \Rightarrow B = 2$$

8)  $x = 10 \cos \theta + 5 \cos 2\theta$   
 $y = 10 \sin \theta + 5 \sin 2\theta$   
 $(0 \leq \theta < 2\pi)$

$= 100 \cos^2 \theta + 100 \cos \theta \cos 2\theta + 25 \cos^2 2\theta$

$+ 100 \sin^2 \theta + 100 \sin \theta \sin 2\theta + 25 \sin^2 2\theta$

i)  $\frac{dy}{d\theta} = 10 \cos \theta + 10 \cos 2\theta$

$= 100(\cos^2 \theta + \sin^2 \theta) + 25(\cos^2 2\theta + \sin^2 2\theta)$

$\frac{dx}{d\theta} = -10 \sin \theta - 10 \sin 2\theta$

$+ 100(\cos \theta \cos 2\theta + \sin \theta \sin 2\theta)$

$\frac{dy}{dx} = \frac{\frac{dy}{d\theta}}{\frac{dx}{d\theta}} = \frac{10 \cos \theta + 10 \cos 2\theta}{-10 \sin \theta - 10 \sin 2\theta}$

$= 100 + 25 + 100 \cos(2\theta - \theta)$

$\frac{dy}{dx} = -\frac{\cos \theta + \cos 2\theta}{\sin \theta + \sin 2\theta}$

$= 125 + 100 \cos \theta$

When  $\theta = \frac{\pi}{3}$

8iii)  $(\text{Distance from } O)^2 = x^2 + y^2$

$$\begin{aligned}\frac{dy}{dx} &= -\frac{\cos \frac{\pi}{3} + \cos \frac{2\pi}{3}}{\sin \frac{\pi}{3} + \sin \frac{2\pi}{3}} \\ &= -\left(\frac{\frac{1}{2} + -\frac{1}{2}}{\frac{\sqrt{3}}{2} + \frac{\sqrt{3}}{2}}\right) \\ &= 0\end{aligned}$$

$\text{Max Dist}^2 = 125 + 100 = 225$

$\text{Max Distance} = 15 \text{ m}$

$\text{Min Dist}^2 = 125 - 100 = 25$

$\text{Min Distance} = 5 \text{ m}$

At A,  $\frac{dy}{dx} = 0$

8iv)  $2 \cos^2 \theta + 2 \cos \theta - 1 = 0$

By calculator  $\cos \theta = 0.3660254$   
 $\cos \theta = -1.3660254$

$x = 10 \cos \frac{\pi}{3} + 5 \cos \frac{2\pi}{3}$

Now  $x^2 + y^2 = 125 + 100 \cos \theta$   
and at B,  $x = 0$

$x = 10 \times \frac{1}{2} + 5 \left(-\frac{1}{2}\right) = \frac{5}{2}$

$\therefore y^2 = 125 + 100 \times 0.3660254$

$y = 10 \sin \frac{\pi}{3} + 5 \sin \frac{2\pi}{3}$

$\Rightarrow y^2 = 161.60254$

$y = 10 \times \frac{\sqrt{3}}{2} + 5 \times \frac{\sqrt{3}}{2} = \frac{15\sqrt{3}}{2}$

$\Rightarrow y = 12.712$

A is point  $\left(\frac{5}{2}, \frac{15\sqrt{3}}{2}\right)$

$\therefore OB = 12.7 \text{ m to 3 s.f.}$

8ii)

$x^2 + y^2 =$

H

$$(10 \cos \theta + 5 \cos 2\theta)^2 + (10 \sin \theta + 5 \sin 2\theta)^2$$
