| Topics | What students need to learn: |  |  |
| :---: | :---: | :---: | :---: |
|  | Content |  | Guidance |
| 10 <br> Vectors | 10.1 | Use vectors in two dimensions and in three dimensions | Students should be familiar with column vectors and with the use of $i$ and $\mathbf{j}$ unit vectors in two dimensions and $\mathbf{i}, \mathbf{j}$ and $\mathbf{k}$ unit vectors in three dimensions. |
|  | 10.2 | Calculate the magnitude and direction of a vector and convert between component form and magnitude/direction form. | Students should be able to find a unit vector in the direction of $a$, and be familiar with the notation $\|\boldsymbol{a}\|$. |
|  | 10.3 | Add vectors diagrammatically and perform the algebraic operations of vector addition and multiplication by scalars, and understand their geometrical interpretations. | The triangle and parallelogram laws of addition. <br> Parallel vectors. |
|  | 10.4 | Understand and use position vectors; calculate the distance between two points represented by position vectors. | $\overrightarrow{O B}-\overrightarrow{O A}=\overrightarrow{A B}=\mathrm{b}-\mathrm{a}$ <br> The distance $d$ between two points $\left(x_{1}, y_{1}\right)$ and $\left(x_{2}, y_{2}\right)$ is given by $d^{2}=\left(x_{1}-x_{2}\right)^{2}+\left(y_{1}-y_{2}\right)^{2}$ |
|  | 10.5 | Use vectors to solve problems in pure mathematics and in context, (including forces). | For example, finding position vector of the fourth corner of a shape (e.g. parallelogram) $A B C D$ with three given position vectors for the corners $A, B$ and $C$. <br> Or use of ratio theorem to find position vector of a point $C$ dividing $A B$ in a given ratio. <br> Contexts such as velocity, displacement, kinematics and forces will be covered in Paper 3, Sections 6.1, 7.3 and 8.1 - 8.4 |
